Description			
<p>I've been looking for a proper email POP3 client like crazy, checked a few dozen programs, and they all have their UNBEARABLE idiosyncrasies, until i found this email client which has some wonderful design decisions (the most important to me being the ability to check the remote mail on POP3 servers, and the fact that messages are stored in separate files such that i don't have to worry about 2GB file limits and "compacting folders" and the likes).</p> <p>In this context, i decided to join this forum and i'll try to give you my input w/r to some usability issues which i find important:</p> <p>The first (and simplest) proposition that i'd like to start with is probably something that would take just A FEW MINUTES to implement, and that is:</p> <p>=====</p> <p>Please add the "remove attachments" command to the right-click menu for a FILE, to the right-click menu for a FOLDER, and to the TOOLS MENU OF AN OPENED MAIL.</p> <p>This command already exists in your client, but it's only available in the "Tools" menu of the main window, and i believe it would be extremely useful (and important from a CONSISTENCY point of view) to have it also on the menus that i mentioned above.=====</p>

It is actually not so simple than it seems to, because the 'Remove attachments' feature is provided as a plug-in. It requires some API enhancements.

But I agree with your opinion, so I might implement it in the future.
